

Gun Deaths in the USA 2012-2014

Yifan Zhang- Student no: s4686474

This presentation showcases cases of gun violence from different perspectives in the USA between 2012 and 2014.

What factors may contribute to the higher incidence of homicides among the 18-28 age group and the higher incidence of suicides among the 48-61 age group?

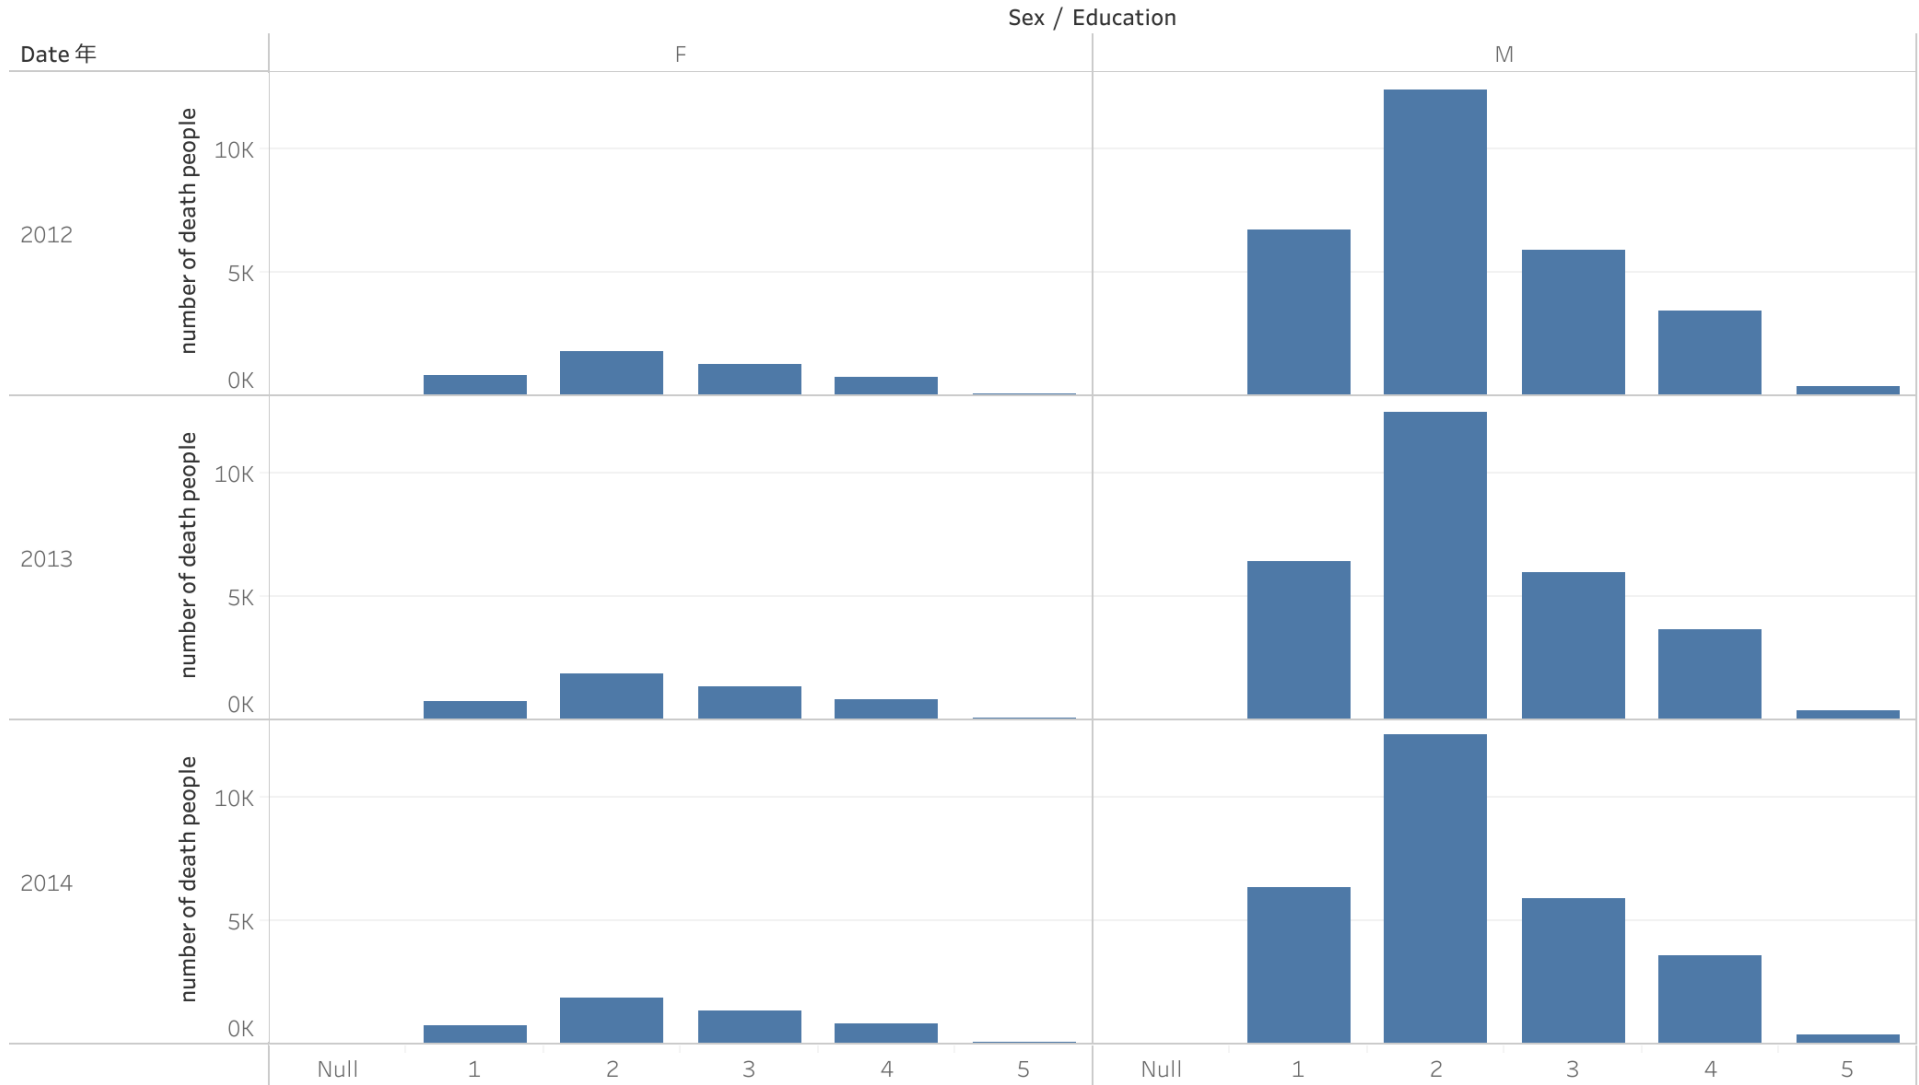

Different causes of death and age over a period of three years.

This bar graph displays the age distribution of deaths by different causes, with the highest number of homicides occurring in the age group between 18-28 years, while the majority of individuals who died by suicide were between the ages of 48-61 years.

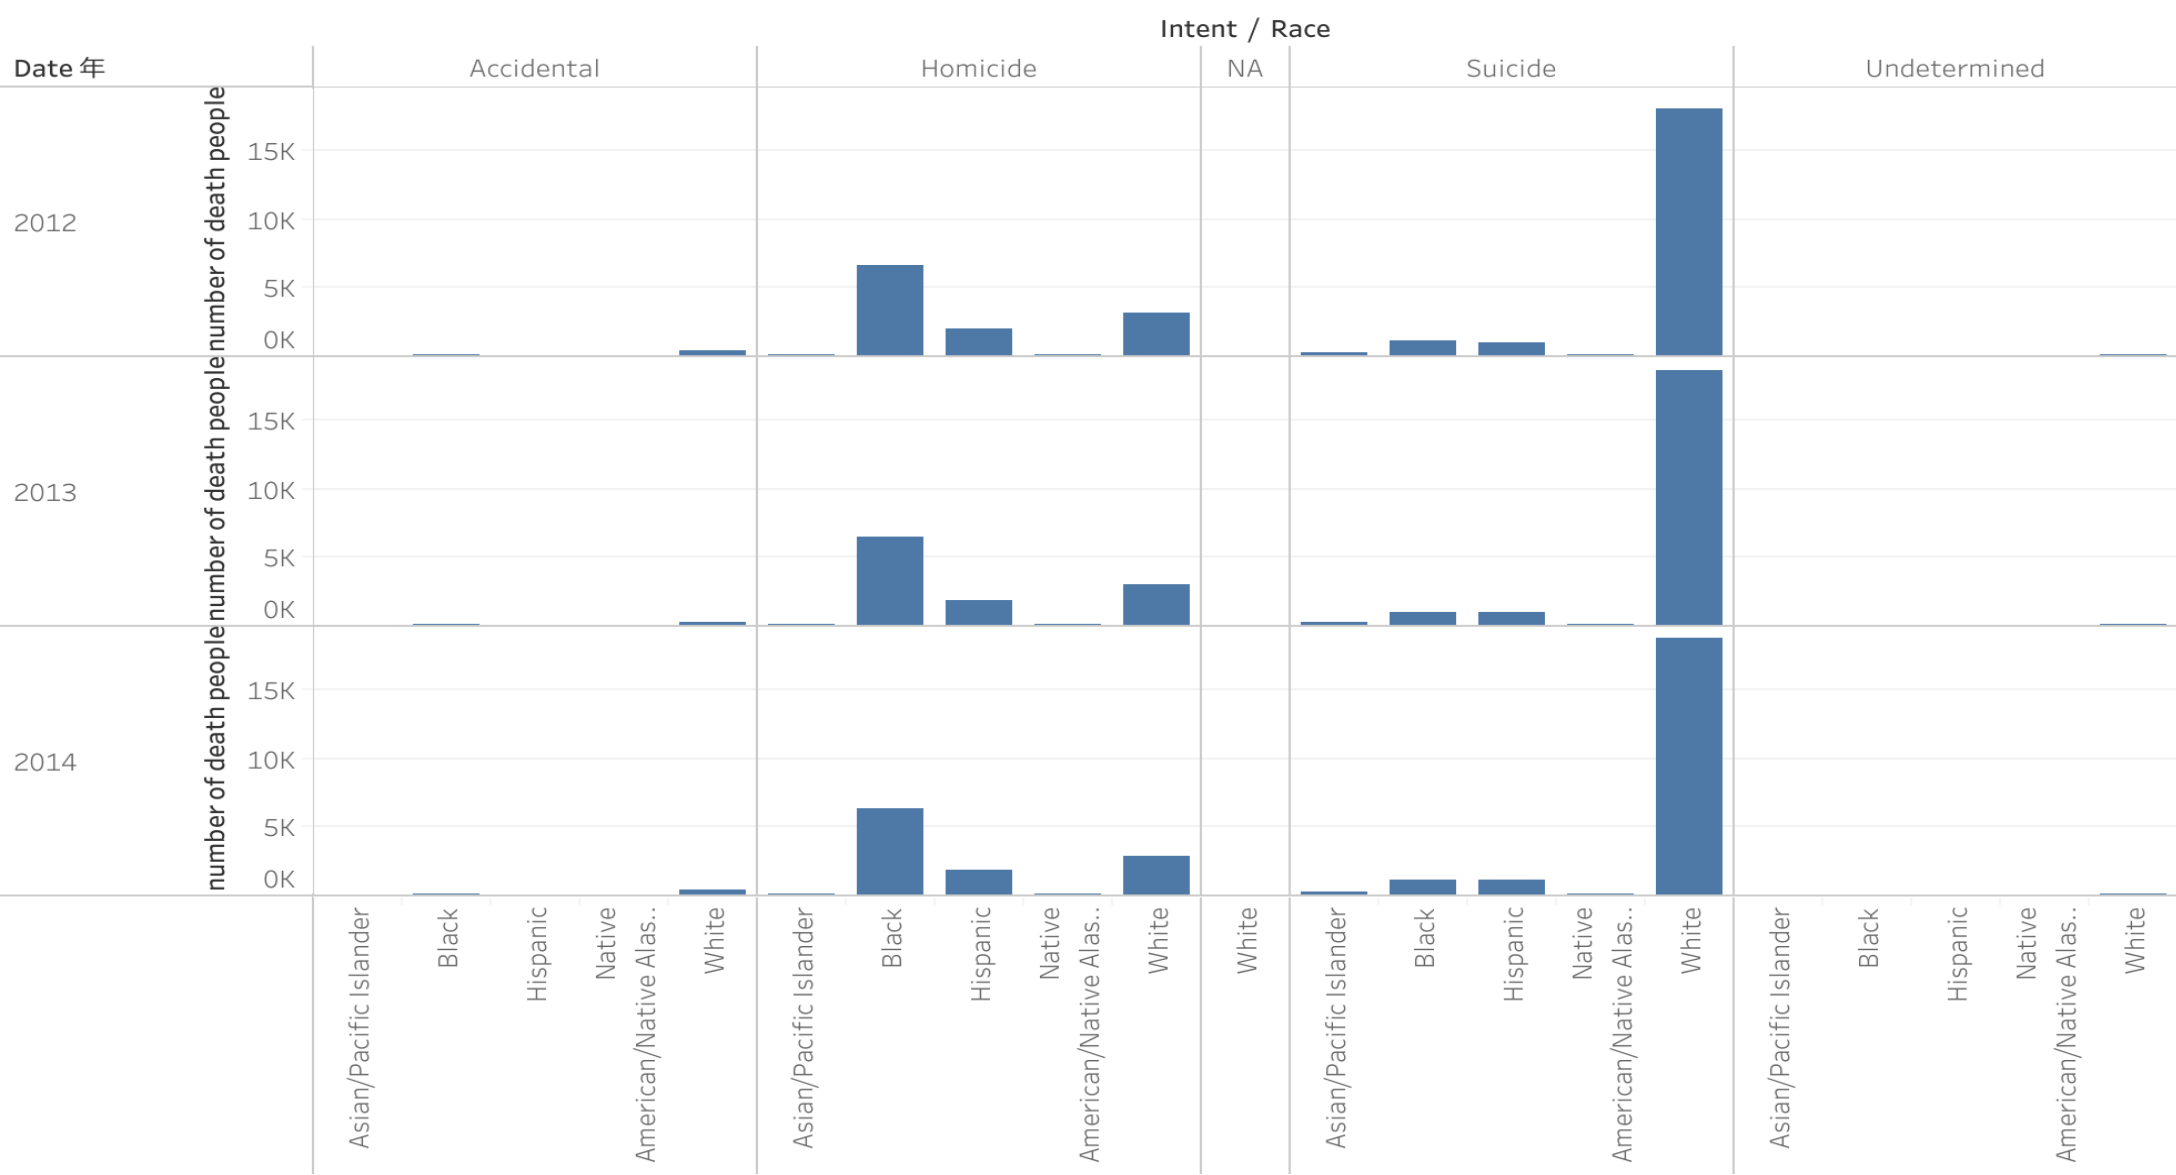

What factors contribute to the higher mortality rates observed among individuals with educational level 2 and how can this be addressed?

Comparison of deaths by gender and educational level over three years.

Through these three different bar graphs from different years, we can clearly observe that the highest number of deaths occurred in the educational level 2 category, followed by a significantly higher number of deaths in males compared to females.

The way people of different races kill in different years

What factors could contribute to the higher rate of suicide among white individuals compared to other races during a three-year period?

By our analysis, the number of whites who committed suicide during this three-year period far exceeded the number of deaths of other race of people
